Limit the spread of COVID-19 with contact tracing.

CLOUD-CONNECTED SAFETY WEARABLES AND DATA ANALYTICS HELP MAINTAIN BUSINESS CONTINUITY

Every day, your teams push business forward. Yet companies are being asked to do even more with much less as the global COVID-19 pandemic has introduced reduced staffing and mandated social distancing guidelines. The result is businesses need to find new and efficient ways to manage their staff and plan a response in the event of a coronavirus case among their workers.

NEW CLOSE CONTACT REPORT

Our **Blackline Vision** data science team has created a new Close Contact report for all Blackline customers. It enables businesses to quickly see which employees may have come into close proximity with a particular worker, over a specific period of time.

- Blackline's connected safety wearables and mobile app are easy to use and help businesses keep workers safe

- Our **G7 devices** and our **Loner Mobile** smartphone app include location technologies that support contact tracing

- The new Close Contact report makes it easy to identify which employees have come into contact with one another

EASY TO USE

The Close Contact report makes it easy to access the location data streamed from our G7 wearables and smartphone app. On the right side of the report, select the required start and end period, then choose an individual from the User list and use the distance slider to specify the separation between users defined as 'contact'. The report will automatically list users who may have come into contact with that individual. You can then export the data as needed.
